4. a) Deduce how potential gradient can be used to determine the electric field intensity. What do you understand by electric dipole moment? [5+1]
- b) Given the potential field $V = 2x^2y - 5z$ and a point $P(-4, 3, 6)$, find at P (i) V (ii) \vec{E} (iii) \hat{a}_E (iv) \vec{D} (v) ρ_v . [5]
5. Explain how the conductivity of metals and semi-conductor changes with increase in temperature. Derive the point form of continuity equation. [3+3]
6. a) State Bio-Savart's law. Derive the equation for magnetic field intensity due to a co-axial cable carrying a uniformly distributed dc current I in the inner conductor and $-I$ in the outer conductor. [2+6]
- b) Given $\vec{H} = (3r^2 / \sin \theta)\hat{a}_\theta + 54r \cos \theta \hat{a}_\phi$, A/m in free space. Find the total current in the \hat{a}_θ direction through the conical surface $\theta = 20^\circ, 0 \leq \phi \leq 2\pi, 0 \leq r \leq 5$. [6]

7. a) Explain how displacement current differs from conduction current. What do you understand by the term magnetization? What does the relative permeability of a substance indicate? [2+1+1]
- b) A 9.4 GHz uniform plane wave is propagating in polyethylene ($\epsilon_r = 2.25$, $\mu_r = 1$).
